

WP3: Brazil case study: Impact of light for all (LfA)

The following specific questions are analysed.

- What is the impact of electrification under LfA on rural households' health and education?
- Does electricity reduced fuel consumption. How much?
- What is the impact of electrification under LfA on rural households' income/employment?
- What is the impact of electrification under LfA on rural households' source of information?
- How communities and local businesses are benefitting from the LfA program?

Model: Impact of electrification

Methodology

- Mixed method approach:
- Desk review
- Quantitative survey data from another survey
- Qualitative field work
- Descriptive analysis of data (originally I planned to carry out econometric analysis/PSM analysis)
- Description of qualitative field work

Problems encountered, what we have learned and way forward

- Quantitative large representative dataset, survey in 2009, 2013 (June to August), we were ensured that 2013 data will be made available, unfortunately we got the prepared Tables and graphs.
- Qualitative field work: added in D3.3
- Lessons learned: Who will do what??
- Way forward: at least this part can be improved by adding some household level FGDs??
- Any other suggestions??

Thank you
